AUTHOR: Gural'nik, S.N., and Zaslavskiy, A.N.

TITLE: A Magneto-Electric Loop Vibrator With Concentrated Liquid Damping (Magnitoelektricheskiy shleyfovyy vibrator s sosredotochennym zhidkostnym uspokoyeniyem)

PERIODICAL: Izmeritel'naya tekhnika, 1959, Nr 3, pp 39-41 (USSR)

ABSTRACT: The possibilities for applying light-beam oscillographs for recording high-speed processes are limited, mainly because of the own frequency of the loop vibrator. It is very difficult to achieve an increase of the own frequency of the vibrator designs presently used. The authors therefore suggest a vibrator design which is radically different from the "classic" systems, by using the principle of concentrated liquid damping (Author's Certificate Nr 102877 and Nr 106854). The mobile part of the vibrator with concentrated liquid damping is not submerged in a liquid filled housing. The loop passes thru some miniature reservoirs, located in some

Card 1/3

SOV/115-59-3-18/29

A Magneto-Electric Loop Vibrator With Concentrated Liquid Damping

limited sections within the working gap of the magnetic system, as shown by figure 1. The working reservoirs are built as cylindrical capillary tubes in which the liquid is kept by the capillary forces alone. The capillary tubes are filled thru auxiliary capillaries, thus the main tubes are always completely filled. Tests with this vibrator damping showed that the length of service is practically unlimited. The own frequency of such a vibrator with concentrated liquid damping is about 80-100% of its own frequency in air, which means that it exceeds twice the frequency of a vibrator submerged in the damping liquid. Also the adjusting of a vibrator with concentrated liquid damping is much simpler, thus these devices may be mass-produced. A table shows the basic parameters of two series of loop vibrators with concentrated liquid damping N135 and N136 which will be produced by the plant "Vibrator". Vibrators of type N135 will be used with MP02

Card 2/3

oscillograph while the type N136 is to be used with new oscillograph models. Figure 4 shows a graphical comparison of the different loop vibrator series which are superior not only to other Soviet models but even to the best foreign models. There are 2 diagrams, 1 table and 4 graphs.

TITLE: An oscillographic galvanometer mounting. Class 21, No. 180692

SOURCE: Izobreteniya, promyshlennyye obrabotsy, tovarnyye znaki, no. 8, 1966, 48

TOPIC TAGS: galvanometer, electric measuring instrument

ABSTRACT: This Author Certificate presents an oscillographic galvanometer mounting with a mobile pickup loop fastened to the tension wires in the tubular casing. The design makes it possible to regulate the position of the pickup loop in the operating gap. The ends of the galvanometer casing are made with grooves in which the tension wire holders are positioned. The tension wire holders have a space which makes it possible to shift the holders in a direction perpendicular to the longitudinal axes of the galvanometer and parallel to the plane of the pickup loop. To provide visual control for positioning the pickup loop in the working gap and to facilitate the installation, the galvanometer casing is provided with viewing windows. One of the holders of the tension wires is made in the form of a P-shaped

TITLE: Frequency response of loop-type oscillograph galvanometers

SOURCE: Izmeritel'naya tekhnika, no. 12, 1964, 28-29

TOPIC TAGS: oscillograph, electromagnetic oscillograph, oscillograph  
galvanometer

ABSTRACT: An experimental investigation of these damping methods used for oscillograph galvanometers is briefly reported: (a) two dampers not filled with liquid; no damping; two pronounced and three small peaks on the frequency curve; (b) one of the dampers is filled with a high-viscosity liquid; three peaks persist; (c) both dampers are filled with the same liquid; all previous peaks disappeared, but a new peak at  $2f_c$  frequency appeared; (d) a low-viscosity liquid is used for damping; some peaks present. The above experiments have shown that, with a

Card 1/2

L 38591-65

ACCESSION NR: AP5004608

concentrated liquid damping of galvanometers, two types of frequency-response distortions occur: (a) those due to the limited damped segments and (b) those due to the complicated nature of the loop (string effect). By using the above experimental data, the number and deployment of dampers can be determined which will render the distortion negligible. Orig. art. has: 1 figure and 1 formula.

"Flame Hardening of Rail Ends on Railroad Tracks," Engineers I. F. Sharov, and Ye. L. Gural'nik

"Avtogen Delo" No 9, pp 25-27

Procedure of flame hardening and tempering ends of rails on RR tracks in operation. Medium-pressure injector-type torch (GPZ-1) was accepted as best heating appliance. Hourly consumption of acetylene is 1850-1950 l; oxygen, 1900-2000 l. Heating head has 24 holes of 0,65 mm diameter spaced at 3 mm intervals. Acetylene generator with productive capacity of 2000-2500 l/hr was part of equipment. Method, in use since 1948, is being applied more widely.

TITLE: Oil and gas deposits of the west Siberian lowland

SOURCE: International Geological Congress. 22d, New Delhi, 1964. Geologiya nefti (Petroleum geology). Moscow, Izd-vo "Nauka," 1964, 244-259

TOPIC TAGS: geology, physical geology, natural gas, petroleum, fuel, seismology

ABSTRACT: The West Siberian lowland is a gigantic intraplateform depression of about 3.4 million square kilometers. There are two structural stages in its basement. The lower (first) stage is built up of folded structure consolidated in different ages— from Archean to Hercynian. The upper (second) stage is composed of slightly dis-located parageosynclinal Early Mesozoic and Paleozoic deposits which fill up inter-montane depressions and form undulated nappes. The cover of the platform is con-structed of thick (up to 4000—5000 meters) series of Meso-Cenozoic sandy-clay rocks. In the rocks of the second tectonic stage of the basement numerous oil and gas shows are known, but structural complexity and the great depths at which oil and gas occur make prospecting very difficult. It is usually done together with studies of oil and gas deposits in the platform mantle, which is considered to be

Card 1/4

47

L 20893-66

ACC NR: AT5028972

the most promising oil- and gas-bearing formation. Within the West Siberian lowland two areas with different modes of mantle deposit occurrence are distinguished: the outer, with the basement lying at a depth of 2000 meters or less, and the inner, from 2000 to 4000—5000 meters deep. The outer area is characterized by nose-type highs sinking towards the center of the platform. The inner area is characterized by domination of closed structures. A great number of local elevations complicating larger structures is observed within both areas. All of them are very gentle (angle of flanks from  $1^{\circ}$  to  $3^{\circ}$ ), with the base protrusion high in the core, noticeably flattening out or passing into structural noses or monoclines in the upper horizons of the mantle. Rhythmical alternation of thick, mainly sand-silt series with essentially clay series is characteristic of the mantle deposits. Almost all Jurassic and Lower Cretaceous sand-silt series are regionally petroliferous. In the section the following stratigraphic units are distinguished through productive deposits: 1) The Zavadoukovski clay-silt-sand series of Early-Middle Jurassic partly of Callovian age, up to 1500 meters thick, characterized by a great diversity of facies including continental deposits of various types—littoral, and, less frequently, marine deposits. Numerous small oil inflows and gas outbursts of short duration were obtained from sandstones of the Zavadoukovski series in the central part of the platform. The small Unst-Silga gas condensate field in the northern part of the Tomsk region is confined to this series. 2) The Maryanovka suite of black highly bituminous argillites, up to 100 meters thick, of Late Jurassic, partly Valanginian-Hauterivian age. Its base consists of a series of basal sandstones unpersistent in the strike, with numerous oil and gas shows. In the western Ural

Card 2/5

L 20093-66

ACC NR: AT5028972

regions of the lowland, where these sandstones directly overlie the basement rocks and are up to 100 meters thick, 16 gas fields and 3 oil fields have been discovered. 3) The Kulomsino suite represented mainly by Valanginian clay rocks, passing in the northwest into the Alyaska suite of Valanginian-Hauterivian age. In the central regions of the lowland numerous oil shows and two oil fields have been revealed in the sandstones of the upper part of this formation. There are essentially sandstone deposits of the Tara (Upper Valanginian-Lower Hauterivian) and Varta (Hauterivian-Barremian) suites further up, which are the main productive formations in the central and northern regions of the lowland. Three oil fields and two gas fields, including large ones, have been discovered there. In the overlying Cretaceous, Paleogene, and Neogene sandy-clay deposits no oil or gas field is known. In the Okhteyevsk area a subcommercial gas spout has been obtained from Senonian sandstones. Oil and gas shows in Cretaceous deposits have been observed in a number of wells. Geochemical investigations have shown that the content of organic carbon and bitumen increases from marginal zones toward the centre of the lowland in all productive strata of Jurassic and Lower Cretaceous age. The degree of bitumen reduction rises, and the degree of oil hypergenesis decreases in the same direction. The degree of mineralization and metamorphism of underground waters also rises from the marginal zones to the center of the lowland. A deviation from normal is observed in the Surgut district, where the degree of mineralization of Jurassic and Lower Cretaceous waters is reduced, and Neocomian oils have undergone considerable cryptohypergenesis. A study of oil and gas reservoirs in Jurassic and Lower Cretaceous deposits has shown deterioration of their properties from the marginal

Card 3/4

L 20893-66

ACC NR: AT5028972

zones of the lowland towards its central regions. At the same time it has been established that paleotectonic conditions greatly affect the properties of reservoirs in Neocomian deposits. The thickest, highly permeable sand beds overlay arches of large consedigenous uplifts. A map of supposed oil and gas reserves on the West Siberian platform has been prepared, based on the results of an analysis of the data available on facial characteristics of rocks, hydrogeology, reservoir properties, geochemistry, distribution of the already known oil and gas fields and shows, etc. The central and northern regions of the lowland are the most promising areas. The data available indicate that the West Siberian lowland is one of the world's new oil and gas provinces. Orig. art. has: 3 figures. [Author's abstract.]

"Some Questions on the Presentation of Industries in Economic School Maps,"  
Issledovaniya po Kartografii (Research in Cartography), Moscow, Geodezizdat,  
1957. 97 p. (Its: Trudy, vyp. 117) 1,700 copies printed.

The author discusses the difficulties connected with the presentation of any large concentration of industrial activities e. g. (the Ruhr, Lancashire, etc) in a small area without omitting some of the activities. The author suggests making two or more maps of the same area and illustrates this with the example of Lodz. He also suggests some symbols to be used for such a map; these symbols are shown on several maps drawn by the author, among them a general economic map of Moravia. The author believes that the lack of adequate information on potential industrial resources, such as the possibilities for power development or the existence of unexploited mineral wealth is one of the major defects of all present-day economic school maps. In his opinion potential industrial resources should be included in school maps on economic conditions in a given area. There are 7 maps and 1 Soviet reference.

## TABLE OF CONTENTS:

Nikishov, M. I., Candidate of Geographic Sciences. Results of Making  
Integrated Maps of Agricultural Conditions in the USSR

3

The author recapitulates the history of agricultural map making in Russia and mentions a few recent maps of some merit (among them those made by Cherdantsev, G. N., Frolov, N. S., and Rakitnikov, A. N.). In connection with the establishment of the economic regions, the author believes that new tasks are imposed upon Soviet map makers. Thus far, however, no outstanding agricultural maps have been made. The author discusses two attempts which deserve some attention. Academician Nemchinov, V. S., and others prepared a map of agricultural conditions and outlined 18 typical regions. The map appeared in the 1955, Nr 4 issue of Planovoye Khozyaystvo. The defect of this map is in its graphical presentation, since the map does not bring out the specialization of each of the 18 regions. Another map discussed in the article is the standard large-scale wall map used in schools since 1952. This map divides the Union into 21 typical farm zones.

Card 2/7

Research in Cartography

278

The author makes numerous suggestions on how best to present an agricultural map and outlines 33 typical farm and animal husbandry regions, although the regions are not outlined with respect to any definite geographical areas. There are no diagrams or references.

Gurari, Ye. I., Candidate of Economic Sciences. Some Questions on the Presentation of Industries in Economic School Maps

21

The author discusses the difficulties connected with the presentation of any large concentration of industrial activities e.g. (the Ruhr, Lancashire, etc) in a small area without omitting some of the activities. The author suggests making two or more maps of the same area and illustrates this with the example of ~~Edel~~. He also suggests some symbols to be used for such a map; these symbols are shown on several maps drawn by the author, among them a general economic map of Moravia. The author believes that the lack of adequate information on potential industrial resources, such as the possibilities for power development or the existence of unexploited mineral wealth is one of the major defects of all present-day economic school maps. In his opinion potential industrial resources should be included in school maps on economic conditions in a given area. There are 7 maps and 1 Soviet reference.

Kel'ner, Yu. G., Candidate of Geographical Sciences; Lozinova, V. M. Candidate of Technical Sciences; Naumova, A. I. Experiments in Making Composite Physicogeographic Maps of the USSR for Use in Schools of Higher Learning 39

The author emphasizes the importance for schools of higher learning, of composite landscape maps, i.e. maps showing all the topographic features of the given region. As an example, the author describes the map "Prirodnyye usloviya SSSR," scale 1:4,000,000, intended to show natural conditions of the country as a whole. This map was prepared in 1950-53 in the cartographic division of the Central Scientific Research Institute of Geodesy, Aerial Photography and Cartography. In 1943-47, the study and preparation of composite maps in the Institute of Geography of the Academy of Sciences was led by Gerasimov, I. P. and Lavrenko, Ye. M. Analytical landscape maps were also compiled by students of Moscow and Leningrad Universities. The author commends Ivanov, N. N. for introducing a better method of showing the amount of humidity in a given area by using different colors. The article contains suggestions on how to deal with various types of vegetation (e.g., coniferous forests) and with phenomena like drainage or evaporation in the preparation of a composite map. There are 18 drawings and 8 Soviet references.

Karpov, N. S., Candidate of Technical Sciences. Contemporary Foreign School  
Atlases

57

The article surveys a number of atlases published outside of the Soviet Union. It does not, however, discuss each individual atlas. The article is divided into chapters, each dealing with one particular aspect of atlas making, such as the utilization of space, the gazetteer, the projections and scales, the system used in compiling the atlas illustrations, etc. There are 29 titles of foreign atlases, of which one half refer to the Soviet satellites and China. There are no diagrams. The article praises foreign atlases for presentation and for richness of pictorial material.

Card 5/7
